                                                                                                                     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         protein search, using frame_plus_n2p model
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Xgapop 10.0 , x

The invention also relates to nucleic acids encoding the protein (AAF27407, AAF27408); variants of the protein (particularly dominant negative variants); vectors and host cells comprising a nucleic acid which encodes an apoptosis and host cells of the invention; the recombinant production of the protein; an antibody against the protein; and methods of screening for compounds which can regulate apoptosis. The apoptosis-related factor is useful in regulating diseases associated with cell proliferation and in screening drug candidates e.g., for regulating cell proliferation or cell death in ischemic diseases and chronic viral diseases. Polynucleotide encoding an apoptosis-associated effector domain and caspase family-cleavage domaineases with cell proliferation. domain, factor protein with death ain, useful in regulating

Claim 3; Page 47-48; 53pp; Japanese.

The invention relates to a novel human apoptosis-associated factor (AAB60386, AAB60387), designated NTZRM1000558, which contains a death effector domain (DED) and a caspase family cleavage domain and is capable of inducing apoptosis in cells. The invention also relates to nucleic acids encoding the protein (AAP27407, AAP27408); variants of the protein (particularly dominant negative variants); vectors and host cells comprising a nucleic acid which encodes an apoptosis- associated factor of the invention; the recombinant production of the protein; an antibody against the protein; and methods of screening for compounds which can regulate apoptosis. The apoptosis-related factor is useful in regulating diseases associated with cell proliferation and in screening drug candidates e.g., for regulating cell proliferation or cell death in

Ĭ.

          CC The invention relates to an isolated polypeptide comprising a death CC domain (DE), death effector domain (DED) or NB-ARC domain. The invention CC is useful for identifying a binding agent, preferably a protein or a drug CC that binds a DD, DED or NB-ARC domain, by contacting a DD, DED or NB-ARC (C domain from DAP3, IRAK4, CTDD (Chlamydia trachomatis DD protein), DED4 or CC (C domain from DAP3, IRAK4, CTDD (Chlamydia trachomatis DD protein), DED4 or CC (C MIDD (NGFR-interacting Death Domain), with a candidate binding agent and CC (D the seasociation of the domain and the candidate binding agent and CC (D the seasociation of the domain and the candidate binding agent (C by yeast two hybrid assay, immunoprecipitation, SPA, ultraviolet (UV) or CC (D the seasopy (MS) and FPA. The invention is useful for modulating the CC (D the seasops such as cell proliferation, cell adhesion, cell celvel of a cell process such as cell proliferation, cell adhesion, cell (C tracs responses, responses to microbial infection and B cell (C antibody specifically reactive with CTDD DD of C trachomatis, C (C muridarum, C. pneumoniae, and C. psittaci or a nucleic acid encoding the C (TDD DD protein suseful for modulating the activity of oncogenic proteins, C (C invention is useful for modulating the activity of bacterial for C treating bacterial infections by modulating the activity of bacterial proteins. The protein and antibody specific for it are useful for C discovery of drugs that suppress infection, inflammation, allergy, c sensis. autoimmunity. allocatef rejection and other diseases. The protein

```

The present invention provides novel death Domain (DD) and death effector domain (DED) proteins and nucleic acids encoding them. The invention also provides death domain containing protein such as Chlamydia trachomatis death domain containing protein (CTDD) DD and neural growth factor receptor-interacting death domain (NTDD) DD and neural growth factor identifying a binding agent (e.g. protein or drug) that binds a DD, DED or NB-ARC domain from DAP3, IRAK4, CTDD, DED4 or NIDD with a candidate

binding

agent

identifying

an

effective agent

New polypeptide comprising a death domain or death effector domain, useful for discovery of drugs that suppress infection, inflammation, allergy, sepsis, autoimmunity, allograft rejection and other diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC that modulates the association of a DD, DED or NB-ARC domain with protein CC that binds the DD, DED or NB-ARC domain. The invention is also useful for CC modulating the level of cell process such as apoptosis, cell adhesion, CC cell proliferation, cell stress responses, responses to microbial CC infection and B cell immunoglobulin class switching. DDs, DEDs and NB-ARC domains and/or anti-DED or anti-NB-ARC domain antibodies are CC useful for discovery of drugs that suppress infection, autoimmunity, CC inflammation, allergy, allograft rejection, sepsis and other diseases. CC DD, DED or NB-ARC domain proteins are used to treat infection, allergy, autoimmunity, inflammation, allograft rejection, sepsis, keratinocyte CC autoimmunity, inflammation, allograft rejection, sepsis, keratinocyte CC hyperplasia, neoplasia, keloid, benign prostatic hypertrophy, fibrosis, CC inflammatory hyperplasia and smooth muscle cell proliferation in arteries CC following balloon angioplasty (restenosis). The invention is also used in CC antibody therapy and gene therapy. The present sequence is human DED4 cortein. The DED4 gene is located on chromosome 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 318
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          No . .

The invention provides human apoptosis regulator (APRG) polypeptides and polynucleotides. The APRG polypeptides, polypucleotides and modulators are useful for diagnosis, treatment and prevention of cell proliferative, immunological and reproductive disorders. The cell proliferative disorders include cancers, actinic keratosis, arteriosclerosis, and immunological disorders include acquired immunodeficiency syndrome (AIDS), adult respiratory distress syndrome, Addisord, osteoporosis, and ankylosing spondylitis, amyloidosis, allergies, anemia, osteoporosis, autoimmune hemolytic anemia, asthma, autoimmune thyroiditis, Crohm's disease, contact dermatitis, diabetes mellitus, gout, Graves' disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Tang
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        APRG; apoptosis regulator; cytostatic; antiatherosclerotic; osteopathic; antiatteriosclerotic; hepatottorpoic; antipsoriatic; anthelmintic; human; antiallergic; antianemic; antiasthmatic; antithyroid; anti-HIV; cancer; antiinflammatory; antidiabetic; antigout; nephrotropic; ophthalmological; immunosuppressive; dermatological; antiulcer; antirheumatic; fungicide; antiarthritic; antibacterial; virucide; antiparastitic; protozoacide; tranquilizer; vulnerary; gynecological; vasotropic; gene therapy.

Reproductive disorders include disorders of prolactin production, infertility, endometriosis, polycystic ovary CC syndrome, ectopic pregnancies, galactorrhea, abnormal sperm physiology, CC disruptions of spermatogenesis, cancer of testis and prostate, impotence, CC carcinoma of male breast and gynecomastia. The APRG polynucleotides are CC useful for creating knockin humanized animals or transgenic animals to CC model human disease and to detect and quantify gene expression in CC biopsied tissues in which expression of APRG is correlated with disease. CC APRG, fragments of it and antibodies specific for APRG are useful as CC elements on a microarray which is useful to monitor or measure protein-cc protein interactions, drug-target interactions and gene expression CC profiles. The present sequence represents a human APRG polypeptide

Also described: (1) primer and probe for investigat of the DEDD2 gene; and (2) reagents for gene therapy. DEDD2 has cytostatic activity. DEDD2 can be used in the diagnosis and treatment cancers of the kidney, large intestine and prostate, and acute and chronic myeloid leukaemia.

The colon CC cancer antigens have cytostatic activity and can be used in gene therapy CC and vaccine production. N and P may be used in the prevention, diagnosis CC and treatment of diseases associated with inappropriate P expression. For CC example, N and P may be used to treat disorders associated with decreased CC expression by rectifying mutations or deletions in a patient's genome CC that affect the activity of P by expressing inactive proteins or to CC supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P CC can be used in the prevention, diagnosis and treatment of colorectal CC carcinomas and cancers. AMH37196 to AMH37204 and AMB7789 represent CC gequences used in the exemplification of the present invention. N.B. CC Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027 CC time of publication, meaning no sequences are present for SEQ ID NO:1027

One hundred and twenty eight novel nucleic acid treating and diagnosing e.g. cancer, asthma and Alzheimer's. for

Claim 6; Page 149-151; 290pp; English.

CC ABL39691 to ABL39818 represent novel human nucleic acid sequences cc encoding the proteins given in ABB06037 to ABB06164. The novel sequences (NS) can have cytostatic, osteopathic, gynaecological, neuroprotective, cantirhematic, antiarthritic, antisoriatic, ophthalmological, virucide, vasotropic, antiarteriosclerotic, antiinflammatory, dermatological, cardiovascular, antifibrinolytic, hypotension, antiasthmatic, cardiant, cardiant, antifibrinolytic, hypotension, antiasthmatic, cardiant, cc anticoagulant, antifibrinolytic, cardiabetic, tranquilliser, antiulcer, anticoagulant, antifibrinolytic, carcines, cc anticoagulant, gastrointestinal, aeuroleptic, cerebroprotective, cc noctropic and contraceptive activities. The NS can be used in vaccines, cc gene therapy and antisense therapy. Nucleic acids, expression vectors and cc disgnosing e.g. cancer, osteoporosis, endometriosis, degenerative cc diseases, dystonia, multiple sclerosis, rheumatoid arthritis, psoriasis, cataracts, restenosis, atherosclerosis, inflammation, skin disorders, cataracts, restenosis, atherosclerosis, inflammation, skin disorders, cc disease, coagulation disease, ischaemia, hypertension, asthma, immune cc disease, epilepsy, angina, neurodegeneration, diabetes, anxiety, cc depression, schizophrenia, viral disease, gastric ulcers, stroke, cc Alzheimer's disease and as contraceptive and

```
CC encoding the proteins given in ABB06037 to ABB06164. The novel sequences CC (NS) can have cytostatic, osteopathic, synaecological, neuroprotective, CC antirheumatic, antiarthritic, antisporiatic, ophthalmological, virucide, CC vasotropic, antiarteriosclerotic, antiinflammatory, dermatological, cardiant, anticoagulant, antiinflammatory, cardiovascular, CC anticoagulant, antiinflammatory, antiasthmatic, cardiant, CC anticoagulant, anticonvulsant, antidiabetic, tranquilliser, antiulcer, CC antidepressant, gastrointestinal, aeuroleptic, cerebroprotective, antidepressant, gastrointestinal, aeuroleptic, cerebroprotective, CC antidepressant, gastrointestinal, aeuroleptic, cerebroprotective, cc entripedra and contraceptive activities. The NS can be used in vaccines, CC gene therapy and antisense therapy. Nucleic acide, expression vectors and claignosing e.g. cancer, osteoporosis, endometriosis, degenerative cd diseases, dystonia, multiple sclerosis, rheumatoid arthritis, psoriasis, CC claracts, restenosis, atherosclerosis, inflammation, skin disorders, CC glaucoma, obesity, muscular dystrophy, AIDS, infertility, cardiovascular cdisease, epilepsy, angina, neurodegeneration, disbettes, anxiety, CC depression, schizophrenia, viral disease, gastric ulcers, stroke, cv vv
One hundred and twenty eight novel nucleic acid sequences, useful treating and diagnosing e.g. cancer, asthma and Alzheimer's.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                infertility; cardiovascular disease; coagulation disease; hypertension; ischaemia; asthma; immune disease; epilepsy; angina; neurodegeneration; diabetes; anxiety; depression; schizophrenia; viral disease; stroke; gastric ulcer; Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           N-PSDB;

CC Polynucleotide sequences AAF17982 - AAF18424 encode human lung cancer CC associated proteins represented in AAB58106 - AAB58548. Lung cancer CC associated proteins and polynucleotide sequences, their agonists, and CC antagonists may have neuroprotective; cytostatic; cardioactive; and CC immunomodulatory; muscular active general; vulnerary; gastrointestinal CC general; nephrotropic; antiinfective; gynecological; or antibacterial CC or polynucleotide sequences. The lung cancer associated polynucleotide sequences ark concer associated polynucleotide cc gequences may be used for detection of lung cancer, chromosome CC or research purposes. The proteins may be used to treat disorders such as CC or research purposes. The proteins may be used to treat disorders such as CC or research purposes. The proteins may be used to treat disorders such as CC or research purposes. The proteins may be used to treat disorders such as CC or research purposes. The proteins may be used in the treatment of wounds and infectious diseases.

CC polynucleotide sequences AAF18433 and peptide AAB58549 are used in the course of the invention for the identification and CC characterisation of the polynucleotide and protein sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 2000-587514/55.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to the isolation of genes encoding 9 human apoptosis-related proteins. The nucleotide sequences AAA95790-A95798 encode the human apoptosis related proteins be sequences AAA95790-A95798 encode the human apoptosis related proteins by linking to the genes can be used to generate fusion proteins by linking to the gene for the human immunoglobulin G Fc (IgG Fc) portion (AAA95799) for increasing the stability of the fusion protein as compared to the human protein only. The gene and encoded protein may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate apoptosis associated protein expression, e.g. cancer (e.g. colon, breast and prostate cancer, melanomas and lymphomas), inflammation, autoimmune disorders (e.g. multiple sclerosis) and viral infections (e.g. herpes))
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence

AAH99166 to AAH99904 encode the human proteins given in AAM25225 to AAW25963. The proteins can have activities based on the tissues and cells they are expressed in, such as: antinflammatory, antirheumatic; antiarthritic; immunosuppressive; antibacterial; endocrine; cardiant; central nervous system; virucide; anti-HTV; fungicide; antimutagen; cardiovascular; antianaemic; antiaggregant; haemostatic; vulnerary; antiucer; osteopathic; dermatological; antiallergic; antiastimatic; antidiabetic; cytostatic; neuroprotective; antidepressant; nootropic; antiparkinsonian; and immunostimulant. The proteins and polymucleotides encoding them can be used in gene therapy, antisense therapy and vaccine production, The proteins and polymucleotides are useful for screening for agonists or antagonists of a protein and for the treatment and diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  23-DEC-1999;

                                                                                                                                                                                                 The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAMA6221.3) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity, such as: Immune system suppression, Activin/inhibin activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arrhritis and inflammation, leukaemias and cart of the reinforce activity, arrhritis and inflammation, leukaemias and cart of the reinforce activity sequence data for this patent did not form
                                                                                                                                                                                                                                                                                                                                                                                                           Novel nucleic acids and polypeptides, useful as central nervous system injuries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                N-PSDB;
